I just began reading this pdf. It is actually writter in straightforward words instead of hard to understand. Once you begin to read the book, it is extremely difficult to leave it before concluding.

Excerpt from Hypercube Algorithms and Implementations: February 1986 The hyperbolic equations are the easiest to parallelize, and in fact we have parallelized various hyperbolic solvers by adding as little as one line of code to the corresponding serial code see section below. We have used several parallelization strategies for hyperbolic equations and we compare these from the point of view of computational efficiency. The simplest method is not the most efficient. However it is quite sufficient as computa tion already substantially dominates communication costs even for this method. From a software point of view we prefer the simpler approach trading a small amount of efficiency for a large decrease in software complex ity. Furthermore we have used the same parallelization strategy, which we call Transpose Splitting Parallelization, for various other applications, includ ing an fft-based fast Poisson solver see sections 8 and 14. The basic observation underlying this approach is that an efficient parallel matrix tran spose can be used to parallelize a numerical algorithm of adi or operator splitting type.
