Excerpt: .of Henson Creek and gradually thin out eastward. They have not been found east of Nellie Creek. These andesites occur in flows varying from a few feet to more than 100 feet in thickness. Below the Burns tuff occur nearly identical sheets of rock, which have not been distinguished on the map. In several places it is clear that these lower bodies have been intruded, and they no doubt belong to the same epoch of eruption as the flows above the tuffs. In El Paso Gulch and the ridge east of it the evidence of intrusion is plain and is expressed in part on the geologic map. The pyroxene andesites are dark porphyritic rocks, with numerous crystals of augite and plagioclase visible to the unaided eye. They are massive except in the upper zones of most flows, where a pronounced vesicular texture is commonly...
