

Variation in Phenology and Monoterpene Patterns of Defoliated and Nondefoliated Douglas-Fir (Pseudotsuga Menziesii Var. Glauca) (Classic Reprint) (Paperback)

Filesize: 7.8 MB

Reviews

This publication will never be straightforward to get going on looking at but really fun to see. This can be for all those who statte that there had not been a worth looking at. You wont really feel monotony at at any moment of your own time (that's what catalogs are for about should you request me).

Forgotten Books, 2018. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Variation in Phenology and Monoterpene Patterns of Defoliated and Nondefoliated Douglas-Fir (Pseudotsuga Menziesii Var. Glauca) Although resistance traits are controlled genetically, their phenotypic expression can be modified substantially by environmental factors (hanover 1975, Mattson and Haack Although environmentally induced phenotypic variation would be minimal for individuals of the same species occupying a relatively comparable microsite, they exhibit differential levels of defoliation (mcdonald 1979, 1981; Perry and Pitman 1983) Because foliage quality, particularly secondary chemicals, seem to play a significant role in plant-host susceptibility and resistance, the hereditability of chemicals such as mono terpenes (squillace 1976) may be beneficial for tree breeding. An important question is whether observed differences in defoliation by Douglas-fir provide a potential manage ment opportunity, that is, whether they would be useful in tree improvement. One of our objectives was to determine if differences in the monoterpene composition of new foli age contribute to differences observed between severely and slightly defoliated Douglas-fir trees. We tested this by examining pairs consisting of each type of tree in an area that is currently undergoing a severe budworm outbreak. A second objective was to determine differences in foliage phenology between trees resistant and those susceptible to budworm to assess if this attribute makes some trees resistant to spruce budworm. The study area was about 8 kilometers east of Cove, Oregon, in the wallowa-whitman National Forest at 1640 meters elevation. Ten pairs of Douglas-fir trees were selected in a mixed-conifer stand experiencing heavy defoliation by C. Occidental/s. Estimates of insect densities for 6 years before the study indicated outbreak populations of 91 to 417 instar lv larvae per square meter of branch area. We chose pairs of trees that had simi lar diameters...
