Iritis generally appears in one eye at a time, but very often the fellow eye is attacked while the disease is still active within the first eye. If iritis is not properly treated in time, it always leads to attachments between the iris and the anterior lens-capsule (posterior synechiae). These are easily detected by the instillation of atropia, under whose action the pupil will assume a very irregular shape, according to the number and extent of the synechiae. (See figure 41). When there is a circular attachment between the pupillary margin of the iris and the anterior lens-capsule, the pupil will remain absolutely unchanged (circular synechia). Vision is always impaired in iritis, although in a varying degree, dependent on the size of the pupil, and the quantity and quality of the inflammatory products in the anterior chamber, and on the anterior lens-capsule. Moreover,...

### Reviews

*I just began reading this pdf. It is actually written in straightforward words instead of hard to understand. Once you begin to read the book, it is extremely difficult to leave it before concluding.*
