When a trinomial, arranged to descending powers of some letter, say x, can be factored into two binomials, it must satisfy the following conditions: (i.) One term of the trinomial is the square of the letter of arrangement, i.e., of the common first term of the binomial factors. (ii.) The coefficient of the first power of the letter of arrangement in the trinomial is the algebraic sum of two numbers whose product is the remaining term of the trinomial. (iii.) These two numbers are the second terms of the binomial factors. 12. Ex. 1. Factor x2 + 8 x +15. The common first term of the binomial factors is evidently x. The second terms are two numbers whose product is 15, and whose sum is 8. By inspection we see that 3 + 5 = 8 and 3x5 = 15; that is, the second terms of the binomial factors are 3 and 5. Consequently, x2 + 8 x + 15 = (a; + 3) (a; + 5). Ex. 2. Factor x2-7 x +12. The common first term of the binomial factors is x. The second terms are two...
